

## **Appendix B. Habitats and Species**

- 2 The American River Basin Region seeks to promote projects that contribute to improved ecosystem
- 3 health. Assessment of projects will include consideration of sensitive species and habitats and the extent
- 4 to which projects contribute to improvements or impacts. Following are a brief description of habitat in
- 5 the Region and the primary species of concern. Also listed are primary nonnative invasive species. These
- 6 are of concern as nonnative species are pervasive throughout the Region and have negative effects such as
- 7 competition with native species, unsuitability as habitat, and harm to recreational use. They may also have
- 8 negative effects on floodways and disrupt natural sedimentation processes.
- 9 Habitat types in the Region include wetland, riverine, riparian, grassland, woodland, cropland, and urban
- 10 forest. Wetlands are found in association with the Region's rivers and creeks and their extended
- 11 watersheds. Riverine habitat includes the aquatic habitat of the Sacramento, American, and Cosumnes
- 12 rivers, as well as lesser sized streams and creeks. Riparian habitat is composed of the bank vegetation and
- 13 forested areas adjacent to the Region's rivers, streams, and creeks; most notable is the riparian habitat
- found along the American River Parkway. Grassland is found throughout the Region's open areas, much
- of it converted from native prairie to grazing land consisting of mostly nonnative grasses. Scattered
- among the grazing land are vernal pools that harbor a number of state of California (state) and federally
- 17 listed species. Blue oak woodland habitat is found on Sacramento County's eastern edge where the valley
- 18 floor transitions to the lower foothills of the Sierra Nevada. Cropland is found through much of rural
- southern Sacramento County drawing irrigation waters from the Sacramento and Cosumnes rivers, as well
- as groundwater wells. The Region's urban forest is comprised of a broad mix of mostly nonnative
- deciduous and evergreen trees with a few stands of remnant and newly planted native oaks (Sacramento
- 22 County, et. al. 2010).
- 23 These habitats support valuable ecological processes and sensitive species. The California Natural
- 24 Diversity Database is a database maintained by California Department of Fish and Wildlife that lists the
- 25 occurrence of sensitive species and habitats within California. Within the Region, there are 20 sensitive
- 26 plant and animal species that are candidates for, or listed as, rare, threatened, or endangered under the
- 27 federal Endangered Species Act and/or the California Endangered Species Act. These species are listed in
- 28 **Table B-1**.

Key:

C = Candidate
E = Endangered
T = Threatened

2

3

- 1 There are also eight sensitive terrestrial communities and two sensitive aquatic communities within the
- 2 Region, listed in **Table B-2**.

3

Table B-2. Sensitive Habitats Within the Region

Terrestrial Communities		
Alkali Meadow		
Alkali Seep		
Elderberry Savanna		
Great Valley Cottonwood Riparian Forest		
Northern Claypan Vernal Pool		
Northern Hardpan Vernal Pool		
Northern Volcanic Mud Flow Vernal Pool		
Valley Needlegrass Grassland		
Aquatic Communities		
Central Valley Drainage Hardhead/Pikeminnow Stream		
Central Valley Drainage Resident Rainbow Trout Stream		

Data Source: CDFW 2012

- 4 As noted above, sensitive species in the Region are strongly impacted by nonnative invasive species,
- 5 which occur in every habitat type throughout the Region. Areas dominated by nonnative weeds prevent
- 6 native plants from establishing, provide poor habitat quality for wildlife, and discourage recreational uses.
- 7 Infestations of weed species increase hydraulic roughness during high-flow events, decrease the capacity
- 8 of the floodway, and adversely affect bank erosion and sedimentation processes. The single largest
- 9 noxious weed infestation is yellow star-thistle. Yellow star-thistle (Centaurea solstitialis) is intolerant of
- 10 flooding and generally restricted to upland settings, but can quickly reinvade and dominate sites within
- several years following a flood event. Other invasive plant species are listed in **Table B-3**.

12

1

Table B-3. Invasive Plant Species Within the Region

Invasive Plant Species
Black locust (Robinia pseudoacacia)
Chinese elm ( <i>Ulmus parvifolia</i> )
Chinese tallow tree (Triadica sebifera)
Cocklebur (Xanthium strumarium)
Fennel (Foeniculum vulgare)
Foxtail brome (Bromus madritensis)
French broom (Genista monspessulana)
Giant reed (Arundo donax)
Himalayan blackberry (Rubus discolor)
Mare's tail ( <i>Hippuris vulgaris</i> )
Oleander (Nerium oleander)
Pampas grass (Cortaderia selloana)
Pepperweed (Lepidium fremontii)
Poison hemlock (Conium maculatum)
Pyrancantha ( <i>Pyracantha sp.</i> )
Red sesbania (Sesbania punicea)
Rip-gut brome (Bromus diandrus)
Siberian elm ( <i>Ulmus pumila</i> )
Spanish broom (Spartium junceum)
Yellow star-thistle (Centaurea solstitialis)

Data Source: Sacramento County 2008

- 2 These invasive plant species are often able to out-compete native plants such as willow (Salix spp.) and
- 3 cottonwood (Populus spp.) and do not provide similar habitat value for fish and wildlife (Sacramento
- 4 County 2008). Invasive animal species in the Region include several nonnative fish species, such as
- 5 American shad (Alosa sapidissima) and striped bass (Morone saxatilis), as well as New Zealand mud
- 6 snail (Potamopyrgus antipodarum), which has been documented in the lower American River (Montana
- 7 State University 2009). The New Zealand mud snail is a concern because if large colonies of exotic snails
- 8 establish, they could successfully compete with native snails and aquatic insects for food, impacting an
- 9 important part of the aquatic food chain (Water Forum 2005).
